The plastid ribosomal proteins. Identification of all the proteins in the 50 S subunit of an organelle ribosome (chloroplast).";

J. Biol. Chem. 275.28466-28482(2000).

L. Siblian THIS PROTEIN BINDS DIRECTLY TO 23S RIBOSOMAL RNA.

-!- FUNCTION: THIS PROTEIN BILON THE CONTRICTLY TO 23S RIBOSOMAL RNA.

-!- FUNCTION: THIS PROTEIN BILON FAMILY OF RIBOSOMAL PROTEINS.

C. -!- MISCELLANEOUS: ON THE 2D-GEL ITS MW IS: 16.5 KDA.

-!- SIMILARITY: BELONGS TO THE L10P FAMILY OF RIBOSOMAL PROTEINS.

Human afamin or a variant and poly:nucleotide(s) encoding it - a human serum protein with activities in common with other members of this family.

Example 3; Page 45; 97pp; English.

Peptides AAR81847-54 are tryptic peptide fragments from human afamin (AAR81845) novel member of the human serum protein family. The fragments were used to design primers and probes (AAT00786-98) for the cloning of the afamin gene (AAT00785) from human liver cDNA. Afamin is thought to have similar properties to human albumin, alpha-foetoprotein and vitamin D binding protein due to homology with these proteins. The gene encodes a mature protein of 66576 daltons without post-translational processing (ca. 87000 daltons with post-translational processing isolated from human plasma by a conventional chromatographic methods. A method has been developed for the diagnosis of human rheumatoid arthritis (RA) using two-dimensional electrophoresis to generate a two-dimensional array of features. The method can be used for screening, diagnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally comprises: (a) analysing a sample of serum or plasma and optionally synovial fluid by two-dimensional electrophoresis, to generate a two-dimensional array of features; (b) identifying at least one chosen feature whose relative abundance correlates with the presence or absence of RA; and (c) comparing the abundance of each chosen feature in the sample indicates the presence or expected or resting the abundance of an electrophoresis for the subject. The method can also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-diagnostic protein isoforms (RPIS), and for production of antibodies to compounds that promote or inhibit their activity, which are then used as Compounds that promote or inhibit their activity, which are then used as compounds that promote or inhibit their activity, which are then used as compounds that promote or inhibit their activity, which are then used as protocols. AAY41844 to AAY42100 represent RPI peptides, AAY42101 to AAY42103 represent expression reference protein isoform peptides and AAZ425066 to AAZ25068 represent degenerate protein isoform peptides and AAZ425066 to AAZ25066 to AAZ25068 represent degenerate protein isoform also
                                                                                                                                                                                            ö
protein can be used to ameliorate ischaemia-reperfusion injury, rheumatoid arthritis, ARDS, cardiopulmonary bypass, sepsis, toxic plasma substances released after inflammation, etc
                                                                                                                                                                                          0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of cerbrospinal fluid (CSF) from the subject one of 223 VD-associated protein isoforms (VPIS) (ABB55801-ABB56295) as fully defined in the specification. Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognosis of VD, for determining the stage or severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                                                                                                                                                                                                                                      Vascular Dementia; VD; VD-associated protein isoform; VPI; screening;

Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognosis of VD, for determining the stage or severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                                                                                                                                    VD; VD-associated protein isoform; VPI; screening;

The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of cerebrospinal fluid (CSP) from the subject one of 223 VD-associated protein isoforms (VPIs) (ABB55801-ABB56295) as fully defined in the specification. Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognosis of VD, for determining the stage or severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                useful for

New schizophrenia associated protein isoforms and encoding nucleic acid molecules, useful for treatment, diagnosis and prognosis of schizophrenia and screening for potential drugs for treatment and new drug targets.
                                                                                                                                                                                                                                                   The sequence represents a schizophrenia-associ|ated protein isoform (SPI). These protein isoforms, e.g. SPI-206, SPI-238 and SPI-240 are detectable in cerebrospinal fluid, serum or plasma and are useful markers of schizophrenia. The sequences can be used for treatment and diagnosis of schizophrenia, screening, prognosis, monitoring the results of therapy, identifying patients most likely to respond to a particular therapy and identification of new targets for drug treatment. SPI DNA is useful as a nucleic acid probe to detect the presence of nucleic acids or SPIs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 24; DB 4; Length 7;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to the identification of depression associated protein isoforms (DPIs), particularly the tryptic digest peptides of these proteins. Some of the DPIs (AAU28404-AAU28625) described are decreased in the cerebrospinal fluid (CSF) of BAD (bipolar affective disorder) subjects, whilst other DPIs (AAU28626-AAU28887) are increased in BAD subjects. Also described are peptide sequences identified from DPI-45 and DPI-213 and the nucleic acid sequence they are encoded by. The sequences of the invention are useful for clinical screening, diagnosis, prognosis, therapy and prophylaxis of neuropsychiatric disorders e.g. BAD (also known as bipolar mood disorder, BP), maniac-depressive illnesses, attention deficit disorders. Sequence represents one of the DPI tryptic digest peptides of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Schizophrenia-associated protein isoform; SPI; SPI-206; SPI-238; SPI-240; neuroleptic; gene therapy; cerebrospinal fluid; serum; plasma.
                                                                                                                                                                                                                                                                                                                                                           Novel nucleic acid encoding a protein associated with bipolar affective disorder, which is used for diagnosis, prophylaxis and therapy of neuropsychiatric disorders, such as bipolar affective disorder.

The invention relates to a preparation comprising an isolated Bipolar Affected Disorder (BAD)-Associated Protein Isoform (DPIs). The DPI's are used to screen, diagnose or prognose of BAD or unipolar depression, identify a subject at risk of developing BAD or unipolar depression, or monitor the effect of therapy in a subject. They are also used to screen for or identify agents that interact with a DPI. These agents, antibodies against the DPIs, and nucleic acids encoding the DPIs are used to treat or prevent BAD or unipolar depression. Diseases that can be treated are attention deficient disorder, a schizoaffective disorder, a bipolar or a unipolar affective disorder. The DPIs are used in proteomics. The proteomic approach of using DPIs for screening, diagnosis or prognosis of proteomic approach of using DPIs for screening, diagnosis or prognosis of expression analysis, such as not being able to obtain central nervous system (CNS) tissue from a living patient under normal circumstances. The present sequence is a DIP decreased in the CSF (cerebro-spinal fluid) of present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 subjects having BAD

Diagnosing and monitoring Schizophrenia by detecting the presence of Schizophrenia Associated Features and Schizophrenia Associated Protein Isoforms in samples of cerebrospinal fluid.

Claim 6; Page 32; 160pp; English

The invention relates to methods and compositions for screening, diagnosis and prognosis of Schizophrenia. The method involves detecting the presence of Schizophrenia (SCH) Associated Features (SFS) and SCH Associated Protein Isoforms (SPIs) in samples, e.g. by electrophoresis, immunoassay or hybridisation assay, for diagnosing and monitoring SCH, studying the effectiveness of treatments and for identifying potential therapeutic agents. The method is used for (1) screening or diagnosis of

The invention relates to methods for the screening, diagnosis and prognosis of Alzheimer's disease. The methods involve the detection of Alzheimer's Disease-Associated Features (AFs) and Alzheimer's Disease-Associated Protein Isoforms (APIs) in cerebrospinal fluid, serum or

```
SCH and the relative abundance of at least 1 chosen feature correlates with the presence or absence of SCH, and (2) monitoring the effect of therapy administered to a subject with SCH and the relative abundance of at least 1 chosen feature which correlates with the severity of SCH. The expression and activity of the SFs, SPIs and related molecules (e.g. secondary messengers) are studied to diagnose SCH, monitor the progress of the disorder and the effectiveness of treatment and as targets to identify and produce potential therapeutic agents for the treatment of SCH. The paucity of detectable neuralgic defects distinguishes neuropsychiatric disorders such as SCH from neurological disorders, where manifestations of anatomical and biochemical changes have been identified in many cases. Consequently the identification and characterisation of cellular and/or molecular causative defects and neuropathies are necessary for improved treatment of neuropsychiatric disorders. AAUISI14-AAUISTAC represent the amino acid sequences of schizophrenia-associated in an and characterisation and characterisation of the secondary many cases the sequences of schizophrenia-associated and characterisation of the secondary many cases the amino acid sequences of schizophrenia-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening for Alzheimer's disease in a mammal, by making two-dimensional array of a feature whose relative abundance correlates with disease, and comparing with abundance of the feature in samples of healthy persons.

The invention relates to methods for the screening, diagnosis and prognosis of Alzheimer's disease. The methods involve the detection of Alzheimer's Disease-Associated Features (AFS) and Alzheimer's Disease-Associated Features (AFS) and Alzheimer's Disease-Associated Protein Isoforms (APIS) in cerebrospinal fluid, serum or Expression Reference Protein Isoform (ERPI) in order to determine whether a patient is suffering from, or has a predisposition to, Alzheimer's Disease. The relative abundance of the AFS and APIS correlates with the produced from an API by proteolysis
plasma. The abundance of the AFs and APIs is then normalised to an Expression Reference Protein Isoform (ERPI) in order to determine whether a patient is suffering from, or has a predisposition to, Alzheimer's Disease. The relative abundance of the AFs and APIs correlates with the severity of Alzheimer's Disease. The present sequence is a peptide produced from an API by proteolysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening for Alzheimer's disease in a mammal, by making two-dimensional array of a feature whose relative abundance correlates with disease, and comparing with abundance of the feature in samples of healthy persons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, neuroprotective, nootropic, gene therapy, vaccine,

This invention relates to a novel method for screening or diagnosing multiple sclerosis (MS) in a subject to determine the stage or severity of MS, to identify a subject at risk of developing MS or to monitor the effect of a therapy administered. The method comprises analysing a sample body fluid from the subject by two-dimensional electrophoresis and correspond to spots identified on a 2D gel these proteins or multiple sclerosis-associated protein isoforms (MSPIs). The MSF's of the invention correspond to spots identified on a 2D gel these proteins may have antiinflammatory or neuroprotective activity. The methods of the invention and the compositions are useful for clinical screening.

CC may have antiinflammatory or neuroprotective activity. The methods of the invention and the compositions are useful for clinical screening.

CC diagnosis and treatment of MS, for monitoring the effectiveness of MS treatment, for selecting participants in clinical trials, for identifying creatment, for selecting participants in clinical trials, for identifying continuate the expression or activity of an MSPI are useful for treatment of MS. Agents that or development of MS, to prevent or delay the progression of MS, or to ameliorate the symptoms MS. Nucleic condissing a sequence encoding an MSPI function by gene coids comprising are useful for promoting MSPI function by gene therapy. The present sequence represents a human multiple sclerosis therapy. The present tryptic digest peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Screening or diagnosing multiple sclerosis (MS), useful for e.g. determining the stage or severity of MS, comprises detecting the presence of MS-associated features or protein isoforms by 2-dimensional

This invention relates to a novel method for screening or diagnosing multiple sclerosis (MS) in a subject to determine the stage or severity of MS, to identify a subject at risk of developing MS or to monitor the effect of a therapy administered. The method comprises analysing a sample body fluid from the subject by two-dimensional electrophoresis and detecting the presence of multiple sclerosis-associated protein isoforms (MSPIs). The MSF's of the invention correspond to spots identified on a 2D gel these proteins may have antiinflammatory or neuroprotective activity. The methods of the invention and the compositions are useful for clinical screening, convention and the compositions are useful for clinical screening, treatment, for selecting participants in clinical trials, for identifying treatment, for selecting participants in clinical trials, for identifying the screening and developing drugs for treatment of MS. Agents that modulate the expression or activity of an MSPI are useful for treating or delaying the onset or development of MS, to prevent or delay the progression of MS, or to ameliorate the symptoms MS. Nucleic cacids comprising a sequence encoding an MSPI function by gene therapy. The present sequence represents a human multiple sclerosis associated feature tryptic digest peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening or diagnosing multiple sclerosis (MS), useful for e.g. determining the stage or severity of MS, comprises detecting the presence of MS-associated features or protein isoforms by 2-dimensional electrophoresis.
                                                                                                                                                                                                                                                    Multiple sclerosis associated feature (MSF) tryptic digest peptide #218.
                                                                                                                                                                                                                                                                                          Multiple sclerosis; MS; multiple sclerosis associated feature; MSAF; human; multiple sclerosis-associated protein isoform; MSPI; antiinflammatory; neuroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          OXFO-) OXFORD GLYCOSCIENCES UK LID.

The present sequence is that of a peptide fragment of a novel human 50.8 kb a prostate cancer-associated protein that has been identified as a highly effective marker for prostate cancer. The novel protein includes a polypeptide that is related to human serum vitamin D binding protein (VDBP, see ABP58017). The present peptide corresponds to amino acids 346-352 of this VDBP allele. It is one of a series of peptides (see ABP58005-16) that distinguish VDBP-related proteins from other proteins, or which may be characterised as binding specifically to an anti-VDBP antibody. VDBP-related proteins are detectable at a higher concentration in serum a healthy mammal and can therefore be used as prostate cancer markers. They permit the rapid detection, preferably before metastases occur, of prostate cancer. A target prostate cancer-associated protein may be detected using a labelled antibody capable of binding specifically to the protein. Prostate cancer-associated proteins, and nucleic acids encoding them, are also useful as targets for treating prostate cancer therapy indicators for monitoring the efficiency of prostate cancer therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing or treating prostrate cancer by detecting in a sample isolated from the individual the presence of prostate cancer-associated protein.

The present invention describes a method for screening, diagnosing or determining the stage or severity of breast cancer, identifying a subject at risk of developing breast cancer, or monitoring the effect of therapy administered to a subject with breast cancer, by generating a two-dimensional array of features comprising breast cancer-associated features (BFS), or quantitatively detecting breast cancer-associated features (BFS), or quantitatively detecting breast cancer-associated compositions comprising; (a) a BFI; (b) a multipody capable of immunospecifically binding to one of the BFIS; (2) a pharmaceutical compositions comprising; (a) a BFI; or a fragment or derivative of the artibody, and a carrier; (a) screening for a fragment or derivative of the antibody, and a carrier; (b) the antibody of (1), or a fragment or derivative of the antibody, or an extraction or activity of one or more BFIS, a BFI fragments, a BFI fragment, a BFI-related or proteins; (4) screening for or identifying agence that modulate the expression or activity of one or more BFIS, a BFI fragment, a BFI-related collyptide, or BFI-fusion proteins; and (5) treating or preventing the collyptide, or BFI-fusion proteins; and (5) treating or preventing or breast cancer. BFIS have oytostatic activity and can be used for screening, diagnoshing or determining the stage or severity of breast cancer. The antibodies, BFIS, administered to a subject with breast cancer. The antibodies, BFIS, administered to a subject with breast cancer. The antibodies of the activity of one or more BFIS are usedful for treating or preventing breast cancer. Collone or more BFIS are usedful for treating or preventing breast cancer. When a secondated tryptic digest performed by which are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening, diagnosing or determining the stage or severity of breast cancer, comprises analyzing and quantitatively detecting Breast Cancer-Associated Features or Breast Cancer-Associated Protein Isoforms in a biological sample.
                                                                                                             Breast cancer associated feature, BF, BPI, breast cancer, diagnosis, breast cancer associated protein isoform, cytostatic, gene therapy.
                                                                Breast cancer associated tryptic digest peptide SEQ ID NO:154.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (OXFO-) OXFORD GLYCOSCIENCES UK LTD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example; Page 77; 88pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US-09-13-3-468A-6

Sequence 6, Application US/09423468A

Sequence 6, Application US/09423468A

Patent No. 6469149

GENERAL INFORMATION:

APPLICANT: Vlaams Interuniversitair Instituut voor Biotechnol

APPLICANT: Mark William Davey

APPLICANT: Description OF ASCORBIC ACID IN PLANTS

FILE REFERENCE: DECLES.001APC

CURRENT APPLICATION NUMBER: US/09/423,468A

CURRENT APPLICATION NUMBER: NL 1006000

PRIOR FILING DATE: 1997-05-07

NUMBER OF SEQ ID NOS: 15

SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 6

Proc. Natl. Acad. Sci. U.S.A. 86, 4624-4628, 1989
A; Title: Two murine natural polyreactive autoantibodies are encoded by nonmutated germ-1 A; Reference number: A33932; MUID:89282823; PMID:2499887
A; Accession: B33932
A; Atatus: preliminary
A; Molecule type: mRNA
A; Residues: 1-6 cBAC>
A; Cross-references: GB:M27107
C; Keywords: immunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A; Accession: A29342
A; Molecule type: protein
A; Residues: 1-7 < HIR>
C; Comment: This peptide exhibits both potentiating (contraction) and inhibitory (relaxat C; Superfamily: unassigned animal peptides
C; Superfamily: unassigned animal peptides
C; Keywords: amidated carboxyl end; hormone; retractor muscle
E; 7/Modified site: amidated carboxyl end (Leu) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                catch-relaxing peptide - blue mussel

SUBSTRATE IN THE LUCIFERASE-CATALYZED REACTION.
-!- CATALYTIC ACTIVITY: ATP + an acid + protein = AMP + diphosphate + an acyl-protein thiolester.
-!- PATHWAY: Bioluminescent fatty acid reduction system; second step.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -!- COFACTOR: Pyridoxal phosphate.
-!- PATHWAY: Biotin biosynthesis.
-!- SUBUNIT: Homodimer.
-!- SIMILARITY: Belongs to class-III of pyridoxal-phosphate-dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

"N-terminal sequence analysis of N alpha-acetylated proteins after unblocking with N-acylaminoacyl-peptide hydrolase.";

Anal. Biochem. 199:45-50(1991).

-!- FUNCTION: This enzyme catalyzes the hydrolysis of the N-terminal peptide bond of an N-acetylated peptide to generate an N-acetylated amino acid and a peptide with a free N-terminus. It preferentially cleaves off Ac-Ala, Ac-Met and Ac-Ser.
-!- CATALYTIC ACTIVITY: Acylaminoacyl-peptide + H(2)0 = acylamino acid
                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Silverstein S., Wagner E.K.;
"Analysis of the herbes simplex virus type 1 promoter controlling the expression of UL38, a true late gene involved in capsid assembly.";
J. Virol. 65:769-786(1991).
-!- FUNCTION: COMPONENT OF THE BASAL LAYER IN WHICH THE CAPSIDS ARE EMBEDDED. BINDS DNA.
-!- SIMILARITY: Belongs to the herpesviruses VP19C family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

CC -!- FUNCTION: THIS PROTEIN BINDS DIRECTLY TO 23S RIBOSOMAL RNA.

CC -!- FUNCTION: THIS PROTEIN ALL PLANT TISSUES.

CC -!- TISSUE SPECIFICITY: EXPRESSED IN ALL PLANT TISSUES.

CC -!- MISCELLANEOUS: ON THE 2D-GEL ITS MW IS: 16.5 KDA.

CC -!- SIMILARITY: BELONGS TO THE LIOP FAMILY OF RIBOSOMAL PROTEINS.

CC -!- SIMILARITY: BELONGS TO THE LIOP FAMILY OF RIBOSOMAL PROTEINS.

RT The plastid ribosomal proteins. Identification of all the proteins in the small subunit of an organelle ribosome (chloroplast).";

The plastid ribosomal proteins. Identification of all the proteins in the small subunit of an organelle ribosome (chloroplast).";

J. Biol. Chem. 37:28455-28465(2000).

CC -!- FUNCTION: THIS PROTEIN BINDS DIRECTLY TO 16S RIBOSOMAL RNA.

CC -!- FUNCTILLAR LOCATION: CHLOROPLAST.

CC -!- MASS SPECTROMETRY: MW=10477.0; METHOD=ELECTROSPRAY.

CC -!- MASS SPECTROMETRY: MW=10477.0; METHOD=ELECTROSPRAY.

CC -!- MASS SPECTROMETRY: MW=10495; METHOD=ELECTROSPRAY.

Antibody for treating respiratory syncytial virus (RSV) infection, comprises a variable heavy/light domain or complementarity determining regions 1 - 3 of variable light/heavy chains, that immunospecifically binds to RSV antigen.

Claim 8; Page 55; 298pp; English.

The invention relates to a novel antibody comprising a variable heavy (VH) domain, variable light (VL) domain, VH complementarity determining region (CDR)-1, VH CDR2, VH CDR3, VL CDR1, VL CDR2 or VL CDR3, where the antibody immunospecifically binds to a respiratory syncytial virus (RSV) antigen, and where the antibody is not SYNAGIS (RTM). The antibody of the invention has virucide, pulmonary, antiinflammatory, cardiant, anti-HIV, and immunostimulant activity. The polynucleotides of the invention may

have a use in a vaccine, and in gene therapy. The antibody is useful for treating or ameliorating a RSV infection in a human. The antibody is also useful for preventing, treating or ameliorating one or more symptoms associated with RSV infection in a mammal, e.g. cystic fibrosis, bronchopulmonary dysplasia, congenital heart disease, congenital immunodeficiency or acquired immunodeficiency, or after a bone marrow transplant. The sequence represents a complementary determining region peptide from a human RSV antibody of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Respiratory syncytial virus; RSV; vaccine; antibody; variable heavy domain; VH; variable light domain; VH; complementarity determining region; CDR; CDR1; CDR2; CDR3; RSV infection; cystic fibrosis; bronchopulmonary dysplasia; congenital heart disease; congenital immunodeficiency; acquired immune deficiency;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antibody comprising a variable heavy (VH) or variable light (VL) domain or complementarity determining region (CDR), such as CDR1, CDR2, or CDR3, useful for preventing or treating a respiratory syncytial virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes an antibody comprising a variable heavy (VH) or variable light (VL) domain or complementarity determining region (CDR), such as CDR1, CDR2, or CDR3, which immunospecifically binds to a respiratory syncytial virus (RSV) antigen and is not SYNAGIS (RTM). The antibody, pharmaceutical compositions and methods are useful for preventing, treating or ameliorating a RSV infection in patients with cystic fibrosis, bronchopulmonary dysplasia, congenital heart disease, congenital immunodeficiency, or acquired immune deficiency, or patients having had a bone marrow transplant or the elderly. This is the amino acid sequence of a respiratory syncytial virus (RSV) antibody peptide
                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Respiratory syncytial virus (RSV) antibody fragment #126.

The invention relates to a method of preventing, treating or ameliorating on one or more symptoms associated with a respiratory syncytial virus (RSV) infection in a mammal. A sustained release formulation comprising one or more antibodies or their fragments that immunospecifically bind to one or more RSV antigens and a pharmaceutical composition comprising one or more artibodies or their fragments that immunospecifically bind to one or more RSV antigens formulated for pulmonary delivery is useful for preventing, treating or ameliorating one or more symptoms associated with a RSV infection in a mammal by administering the formulation to the mammal, or the composition to the lungs of the mammal. The antibodies bind to RSV antigen with a high affinity and/or high avidity. The methods use lower doses of antibodies which immunospecifically bind to RSV antigen, and which provide a more effective prophylaxis. The present sequence region based on the SYNAGIS antibody.

t2.

```
This sequence represents a fragment of the heavy chain (HAI) of the heamagglutinin of influenza virus. This sequence was used to test the acryloylated peptide polymer of the invention. The peptide polymers are used to raise an immune response to a peptide epitope (such as this sequence), and also as diagnostic tools. Polymers (molecular wt. >600 kDa.) can be prepared with virtually any number of the same or different epitopes by a method that allows purification of the individual determinants, avoids errors inherent in long sequential syntheses in which protected peptide fragments are not used, thus avoiding solubility and purification problems. Multiple copies of many different peptide can do purification of the range of T cell epitopes required for outbred pathogenic serodemes, thus making them a significant advance in synthetic vaccine technology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Acryloylated peptide polymers - useful for synthetic vaccine technology, for raising an immune response to peptide epitope and as diagnostic tool
                                                                                                                                       Acryloylated peptide polymer; immune response; peptide epitope; synthetic vaccine; enzymatically cleavable site.
                                                                                                                                                                                                                                                  /note= "linked to acryloylated peptide polymer"

arthritis (RA) using two-dimensional electrons or numerate a two-dimensional array of features. The method can be used for screening, diagnosis and prognosis of RA in a subject or for monitoring the effect of an analysing a sample of serum or plasma and optionally comprises: (a) analysing a sample of serum or plasma and optionally synovial fluid by two-dimensional electrophoresis, to generate a two-dimensional array of features; (b) identifying at least one chosen (feature whose relative abundance correlates with the presence or absence of RA, and (c) comparing the abundance of each chosen feature in the cample with the abundance of that chosen feature in serum or plasma from or more persons without RA, where the relative abundance of the chosen feature or features in the sample indicates the presence or absence of RA in the subject. The method can also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-c diagnostic protein isoforms (RPIS), and for production of antibodies to RPIS. The RA-diagnostic feature (RADF) proteins can be used to identify compounds that promote or inhibit their activity, which are then used as C protocols. AAY41844 to AAY42100 represent RPI peptides, AAY42101 to AAY42103 represent expression reference protein isoform peptides and AAZ5066 to AAZ25068 represent expression function of antibodies or seed in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A method has been developed for the diagnosis of human rheumatoid

dimensional array of features. The method can be used for screening, dimensional array of features. The method can be used for screening, diagnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally synovial fluid by two-dimensional electrophoresis, to generate a two-dimensional array of features; (b) identifying at least one chosen feature whose relative abundance correlates with the presence or absence of RA; and (c) comparing the abundance of each chosen feature in the cample with the abundance of that chosen feature in serum or plasma from one or more persons without RA, where the relative abundance of the chosen feature or features in the sample indicates the presence or absence of RA in the subject. The method can also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-catagnostic feature (RADF) proteins can be used to identify compounds that promote or inhibit their activity, which are then used as RA drugs. Nucleic activity and in soforms (RPIS), and for production of antibodies to protocols. AAY41844 to AAY42100 reference protein isoform peptides and AAY42103 represent expression reference protein isoform peptides and AAY42103 represent expression reference protein isoform peptides and AAX25066 to AAX25068 represent degenerate probes for RPIS, which are all used in the exemplification of the present invention
A method has been developed for the diagnosis of human rheumatoid

The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of cerebrospinal fluid (CSF) from the subject one of 223 VD-associated protein isoforms (VPIs) (ABB55801-ABB56295) as fully defined in the specification. Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognosis of VD, for determining the stage or severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                     Vascular Dementia; VD; VD-associated protein isoform; VPI; screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of cerebrospinal fluid (CSF) from the subject one of 223 VD-associated protein isoforms (VPIS) (ABB55801-ABB56295) as fully defined in the specification. Detecting VD-associated features and VPI is useful for the severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, depression associated protein isoform; tryptic digest peptide; DPI; cerebrospinal fluid; CSF; BAD; bipolar affective disorder; neuropsychiatric disorder; bipolar mood disorder; neuroleptic; maniac-depressive illness; schizoaffective disorder.
                                                                                                                                                                                                  Screening, diagnosis or prognosis of vascular dementia (VD), useful determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61.3%; Score 19; DB 4; Length 7; 66.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of cerebrospinal fluid (CSF) from the subject one of 223 VD-associated protein isoforms (VPIS) (ABB55801-ABB56295) as fully defined in the specification. Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognosis of VD, for determining the stage or severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                         Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Dementia; VD; VD-associated protein isoform; VPI; screening;

                                                                                                                                The present invention relates to the identification of depression associated protein isoforms (DPIs), particularly the tryptic digest peptides of these proteins. Some of the DPIs (AAU28404-AAU28625) described are decreased in the cerebrospinal fluid (CSF) of BAD (bipolar affective disorder) subjects, whilst other DPIs (AAU28626-AAU28887) are increased in BAD subjects. Also described are peptide sequences identified from DPI-45 and DPI-213 and the nucleic acid sequence they are encoded by. The sequences of the invention are useful for clinical screening, diagnosis, prognosis, therapy and prophylaxis of neuropsychiatric disorders e.g. BAD (also known as bipolar mood disorder, BP), maniac-depressive illnesses, attention deficit disorders. The present sequence represents one of the DPI tryptic digest peptides of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New schizophrenia associated protein isoforms and encoding nucleic acid molecules, useful for treatment, diagnosis and prognosis of schizophrenia and screening for potential drugs for treatment and new drug targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Schizophrenia-associated protein isoform; SPI, SPI-206; SPI-238; SPI-240; neuroleptic; gene therapy; cerebrospinal fluid; serum; plasma.
                               Novel nucleic acid encoding a protein associated with bipolar affective disorder, which is used for diagnosis, prophylaxis and therapy of neuropsychiatric disorders, such as bipolar affective disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gape

The sequence represents a schizophrenia-associated protein isoform (SPI). These protein isoforms, e.g. SPI-206, SPI-238 and SPI-240 are detectable in cerebrospinal fluid, serum or plasma and are useful markers of

```
The invention relates to a preparation comprising an isolated Bipolar

Affected Disorder (BAD)-Associated Protein Isoform (DPIs). The DPI's are

used to screen, diagnose or prognose of BAD or unipolar depression,

cetermine the stage or severity of BAD or unipolar depression, identify a

subject at risk of developing BAD or unipolar depression, or monitor the

ceffect of therapy in a subject. They are also used to screen for or

identify agents that interact with a DPI. These agents, antibodies

against the DPIs, and nucleic acids encoding the DPIs are used to treat

or prevent BAD or unipolar depression. Diseases that can be treated are

attention deficient disorder, a schizoaffective disorder, a bipolar or a

attention affective disorder. The DPIs are used in proteomics. The

proteomic approach of using DPIs for screening, diagnosis or prognosis of

BAD or unipolar depression overcomes the problems of using gene

expression analysis, such as not being able to obtain central nervous

system (CNS) tissue from a living patient under normal circumstances. The

present sequence is a DIP decreased in the CSF (cerebro-spinal fluid) of
                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            or
              schizophrenia, screening, prognosis, monitoring the results of therapy, identifying patients most likely to respond to a particular therapy and identification of new targets for drug treatment. SPI DNA is useful as anucleic acid probe to detect the presence of nucleic acids or SPIs
schizophrenia. The sequences can be used for treatment and diagnosis of

The invention relates to methods and compositions for screening, diagnosis and prognosis of Schizophrenia. The method involves detecting the presence of Schizophrenia (SCH) Associated Features (SF8) and SCH Associated Protein Isoforms (SPIS) in samples, e.g. by electrophoresis, immunoassay or hybridisation assay, for diagnosing and monitoring SCH, studying the effectiveness of treatments and for identifying potential therapeutic agents. The method is used for (1) screening or diagnosis of SCH and the relative abundance of at least I chosen feature correlates with the presence or absence of SCH; and (2) monitoring the effect of therapy administered to a subject with SCH and the relative abundance of at least I chosen feature which correlates with the severity of SCH. The expression and activity of the SCH; and related molecules (e.g. cerondary messengers) are studied to diagnose SCH, monitor the progress of the disorder and the effectiveness of treatment and as targets to identify and produce potential therapeutic agents for the treatment of SCH. The paucity of detectable neuralgic defects distinguishes consequently the identification and characterisation of many cases. Consequently the identification and characterisation of cellular and/or molecular causative defects and neuropathies are cellular and/or miproved treatment of neuropsychiatric disorders. Adults14-Adults762 represent the amino acid sequences of schizophrenia-associated isoforms used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing and monitoring Schizophrenia by detecting the presence of Schizophrenia Associated Features and Schizophrenia Associated Protein Isoforms in samples of cerebrospinal fluid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to methods for the screening, diagnosis and prognosis of Alzheimer's disease. The methods involve the detection of Alzheimer's Disease-Associated Features (AFS) and Alzheimer's Disease-Associated Protein Isoforms (APIS) in cerebrospinal fluid, serum or plasma. The abundance of the AFS and APIS is then normalised to an Expression Reference Protein Isoform (ERPI) in order to determine whether a patient is suffering from, or has a predisposition to, Alzheimer's Disease. The relative abundance of the AFS and APIS correlates with the severity of Alzheimer's Disease. The present sequence is a peptide produced from an API by proteolysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Screening for Alzheimer's disease in a mammal, by making two-dimensional array of a feature whose relative abundance correlates with disease, and comparing with abundance of the feature in samples of healthy persons.
                                                                                                Gaps

The invention relates to a novel antibody comprising a variable heavy

(VH) domain, variable light (VL) domain, VH complementarity determining

region (CDR)-1, VH CDR2, VH CDR3, VL CDR1, VL CDR2 or VL CDR3, where the
antibody immunospecifically binds to a respiratory syncytial virus (RsV)
antigen, and where the antibody is not SYNAGIS (RTM). The antibody of the
invention has virucide, pulmonary, antiinflammatory, cardiant, anti-HIV,
and immunostimulant activity. The polynucleotides of the invention may
have a use in a vaccine, and in gene therapy. The antibody is useful for
treating or ameliorating a RSV infection in a human. The antibody is also
useful for preventing, treating or ameliorating one or more symptoms
associated with RSV infection in a mammal, e.g. cystic fibrosis,
bronchopulmonary dysplasia, congenital heart disease, congenital
immunodeficiency or acquired immunodeficiency, or after a bone marrow
transplant. The sequence represents a complementary determining region
c peptide from a human RSV antibody of the invention
                                                                                                                                                                                                 Human, variable heavy domain; variable light domain; CDR; VH; VL; RSV; complementarity determining region; respiratory syncytial virus; virucide; pulmonary; antiinflammatory; cardiant; anti-HIV; vaccine; immunostimulant; gene therapy; cystic fibrosis; bone marrow transplant; bronchopulmonary dysplasia; congenital heart disease; congenital immunodeficiency; acquired immunodeficiency.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibody for treating respiratory syncytial virus (RSV) infection, comprises a variable heavy/light domain or complementarity determining regions 1 - 3 of variable light/heavy chains, that immunospecifically binds to RSV antigen.
                                                                                                                                                               Human RSV antibody VL CDR2 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 8; Page 55; 298pp; English.

Sequence 24, Application US/09897107
; Sequence 24, Application US/09897107
; Patent No. US20020137094A1
; GENERAL INFORMATION:
    APPLICANT: YAMAGISHI, Akihiko
    TITLE OF INVENTION: METHOD FOR IMPROVING THERMOSTABILITY OF PROTEINS, PROTEINS HAVING
    TITLE OF INVENTION: THERMOSTABILITY IMPROVED BY THE METHOD AND NUCLEIC ACIDS ENCODIN
    TITLE OF INVENTION: THERMOSTABILITY IMPROVED BY THE METHOD AND NUCLEIC ACIDS ENCODIN
    TITLE OF INVENTION NUMBER: US/09/897,107
    CURRENT APPLICATION NUMBER: JP2000-201920
    PRIOR FILING DATE: 2001-07-04
    PRIOR FILING DATE: 2001-05-31
    NUMBER OF SEQ ID NOS: 104
    SOFTWARE: Patentin version 3:1
    SEQ ID NO 24
    LENGTH: 6
    TYPE: PRT
    ORGANISM: Saccharomyces cerevisiae
    US-09-897-107-24
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .
